NovaPay server SDK - retry behaviour

Applies to the NovaPay server SDK for Java, Python, Node.js and PHP, version 3.x. Owner: Developer Experience team.

When the SDK retries

The SDK retries a payment request only when it is safe to do so: on network errors and on HTTP 502, 503 and 504. It never retries on 4xx responses.

Retry schedule

To avoid retry storms during an outage, the SDK does not retry immediately. It puts the request in a local retry queue and sends it again after 15 minutes. If that attempt also fails, it makes one last attempt 30 minutes later.

Idempotency

Every retry reuses the original Idempotency-Key header. As long as payments-api still holds the key, a retry returns the original result and the card is not charged again.

Advice for merchants

Do not add your own retries on top of the SDK. After a timeout, show the customer a "payment pending" message and wait for the payment.captured webhook.
